100 Years of the Radon Transform Linz, March 27-31, 2017

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

Solve

$$Kx = y$$

in discrete setting

- $x \in \mathbb{R}^{p}$ = vector of coefficients describing the unknown object
- $y \in \mathbb{R}^n$ = vector of (noisy) data
- K = linear operator (n × p matrix) modelling the link between the two

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Noisy data \rightarrow solve approximately by minimizing contrast (discrepancy) function, e.g. $\|Kx - y\|_2^2$

Ill-conditioning \rightarrow regularize by adding constraints/penalties on the unknown vector *x* e.g.

- on its squared L^2 -norm $||x||_2^2 = \sum_i |x_i|^2$ (classical quadratic regularization)
- on its L¹-norm ||x||₁ = Σ_i |x_i| (sparsity-enforcing or "lasso" regularization, favoring the recovery of sparse solutions, i.e. the presence of many zero components in x)
- on a linear combination of both ||x||₁ and ||x||₂² norms ("elastic-net" regularization)
- plus here positivity constraints (hold true in many applications)

Positivity and multiplicative iterative algorithms

 Poisson noise → minimize (log-likelihood) cost function subject to x ≥ 0 (assuming K ≥ 0 and y ≥ 0)

$$F(x) = KL(y, Kx) \equiv \sum_{i=1}^{n} \left[y_i \ln \left(\frac{y_i}{(Kx)_i} \right) - y_i + (Kx)_i \right]$$

(Kullback-Leibler – generalized – divergence)

- Richardson (1972) Lucy (1974) (an astronomer's favorite) = EM(ML) in medical imaging
- Algorithm: $x^{(k+1)} = \frac{x^{(k)}}{K^T \mathbf{1}} \circ K^T \frac{y}{Kx^{(k)}}$ (k = 0, 1, ...)(using the Hadamard (entrywise) product \circ and division; **1** is a vector of ones)
- Positivity automatically preserved if $x^{(0)} > 0$
- Unregularized \rightarrow semi-convergence \rightarrow usually early stopping
- Can be easily derived through separable surrogates

Surrogating

Figure : The function in red and his surrogate in green

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

Surrogating

• Surrogate cost function *G*(*x*; *a*) for *F*(*x*):

 $G(x; a) \ge F(x)$ and G(a; a) = F(a)

for all x, a

MM-algorithm (Majorization-Minimization):

$$x^{(k+1)} = \arg\min_{x} G(x; x^{(k)})$$

Monotonic decrease of the cost function is then ensured:

$$F(x^{(k+1)}) \leq F(x^{(k)})$$

(Lange, Hunter and Yang 2000)

Surrogate for Kullback-Leibler

Cost function ($K \ge 0$ and $y \ge 0$)

$$F(x) = \sum_{i=1}^{n} \left[y_i \ln \left(\frac{y_i}{(Kx)_i} \right) - y_i + (Kx)_i \right]$$

Surrogate cost function (for $x \ge 0$)

1

$$G(x; a) = \sum_{i=1}^{n} \left[y_i \ln y_i - y_i + (Kx)_i + \frac{y_i}{(Ka)_i} \sum_{j=1}^{p} K_{i,j} a_j \ln \left(\frac{x_j}{a_j} (Ka)_i \right) \right]$$

NB. This surrogate is separable, i.e. it can be written as a sum of terms, where each term depends only on a single unknown component x_i .

Positivity and multiplicative iterative algorithms

• Gaussian noise \rightarrow minimize (log-likelihood) cost function subject to $x \ge 0$

$$F(x) = \frac{1}{2} \|Kx - y\|_2^2$$

assuming $K \ge 0$ and $y \ge 0$

- ISRA (Image Space Reconstruction Algorithm) (Daube-Witherspoon and Muehllehner 1986; De Pierro 1987)
- Iterative updates

$$x^{(k+1)} = x^{(k)} \circ \frac{\kappa^T y}{\kappa^T \kappa x^{(k)}}$$

- Positivity automatically preserved if x⁽⁰⁾ > 0
- Unregularized → semi-convergence → usually early stopping
- Easily derived through separable surrogates

Surrogate for Least Squares

Cost function ($K \ge 0$ and $y \ge 0$)

$$F(x) = \frac{1}{2} \|Kx - y\|_2^2$$

Surrogate cost function (for $x \ge 0$)

$$G(x; a) = \frac{1}{2} \sum_{i=1}^{n} \frac{1}{(Ka)_{i}} \sum_{j=1}^{p} K_{i,j} a_{j} \left[y_{i} - \frac{x_{j}}{a_{j}} (Ka)_{i} \right]^{2}$$

NB. This surrogate is separable, i.e. it can be written as a sum of terms, where each term depends only on a single unknown component x_j

▲□▶▲□▶▲□▶▲□▶ □ のQで

Blind Inverse Imaging

- In many instances, the operator is unknown ("blind") or only partially known ("myopic" imaging/deconvolution)
- The resulting functional is convex w.r.t. x or K separately but is not jointly convex → possibility of local minima
- Usual strategy: alternate minimization on x (with K fixed) and K (with x fixed)
- The problem can be easily generalized to include multiple inputs/unknowns (*x* becomes a *p* × *m* matrix *X*) and multiple outputs/measurements (*y* becomes a *n* × *m* matrix *Y*) e.g. for Hyperspectral Imaging

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

$$\longrightarrow$$
 solve $KX = Y$

Special case: Blind Deconvolution

- When the imaging operator *K* is translation-invariant, the problem is also referred to as "Blind Deconvolution"
- Alternating minimization approaches using (regularized) least-squares (Ayers and Dainty 1988; You and Kaveh 1996; Chan and Wong 1998, 2000) or Richardson-Lucy (Fish, Brinicombe, Pike and Walker 1996)
- Bayesian approaches are also available
- An interesting non-iterative and nonlinear inversion method has been proposed by Justen and Ramlau (2006) with a uniqueness result. Unfortunately, their solution has been shown to be unrealistic from a physical point of view by Carasso (2009)

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Blind Inverse Imaging, Positivity and NMF

- Blind imaging is difficult \rightarrow use as much a priori information and constraints as you can
- In particular, positivity constraints have proved very powerful when available, e.g. in incoherent imaging as for astronomical images
- The special case where all elements of K, X (and Y) are nonnegative (K ≥ 0, X ≥ 0) is also referred to as "Nonnegative Matrix Factorization" (NMF)
- There is a lot of recent activity on NMF, as an alternative to SVD/PCA for dimension reduction
- Alternating (ISRA or RL) multiplicative algorithms have been popularized by Lee and Seung (1999, 2000) See also Donoho and Stodden (2004)

- · Develop a general and versatile framework for
- blind deconvolution/inverse imaging with positivity,
- equivalently for Nonnegative Matrix Factorization,
- with convergence results to control not only the decay of the cost function but also the convergence of the iterates,

- with algorithms simple to implement
- and reasonably fast...

We will consider

- Blind deconvolution with positivity (from single or multiple images)
- Hyperspectral Imaging
- Dynamic Positron Emission Tomography (PET)

NB. There are many other applications of NMF

▲□▶▲□▶▲□▶▲□▶ □ のQで

Minimize the cost function, for K, X nonnegative (assuming Y nonnegative too),

$$F(K,X) = \frac{1}{2} \|Y - KX\|_{F}^{2} + \frac{\mu}{2} \|K\|_{F}^{2} + \lambda \|X\|_{1} + \frac{\nu}{2} \|X\|_{F}^{2}$$

where $\|\cdot\|_F^2$ denotes the Frobenius norm $\|K\|_F^2 = \sum_{i,j} K_{i,j}^2$

• The minimization can be done column by column on *X* and line by line on *K*

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Regularized least-squares (Gaussian noise)

 Alternating multiplicative algorithm (1_{p×m} is a p×m matrix of ones)

$$\begin{aligned} & \mathcal{K}^{(k+1)} &= \mathcal{K}^{(k)} \circ \frac{Y(X^{(k)})^T}{\mathcal{K}^{(k)}X^{(k)}(X^{(k)})^T + \mu \mathcal{K}^{(k)}} \\ & \mathcal{X}^{(k+1)} &= \mathcal{X}^{(k)} \circ \frac{(\mathcal{K}^{(k+1)})^T Y}{(\mathcal{K}^{(k+1)})^T \mathcal{K}^{(k+1)}X^{(k)} + \nu X^{(k)} + \lambda \mathbf{1}_{p \times m}} \end{aligned}$$

- to be initialized with arbitrary but strictly positive $K^{(0)}$ and $X^{(0)}$
- Can be derived through surrogates → provides a monotonic decrease of the cost function at each iteration
- Special cases:
 - a blind algorithm proposed by Hoyer (2002, 2004) for

 $\mu = 0, \nu = 0$

• ISRA for *K* fixed and $\lambda = \mu = \nu = 0$

Regularized least-squares (Gaussian noise)

- Assume μ and either ν or λ are strictly positive and Y has at least one strictly positive element in each row and each column
- Monotonicity is strict iff $(K^{(k+1)}, X^{(k+1)}) \neq (K^{(k)}, X^{(k)})$
- The sequence $F(K^{(k)}, X^{(k)})$ converges
- Asymptotic regularity holds: $\forall i, j$ $\lim_{k \to +\infty} \left(\mathcal{K}_{i,j}^{(k+1)} - \mathcal{K}_{i,j}^{(k)} \right) = 0$; $\lim_{k \to +\infty} \left(\mathcal{X}_{i,j}^{(k+1)} - \mathcal{X}_{i,j}^{(k)} \right) = 0$
- ⇒ the set of accumulation points of the sequence of iterates (K^(k), X^(k)) is compact and connected

If this set is finite, the iterates (K^(k), X^(k)) converge to a stationary point (K^{*}, X^{*}) (satisfying the first-order KKT conditions)

• Minimize the cost function, for *K*, *X* nonnegative (assuming *Y* nonnegative too),

$$F(K,X) = KL(Y,KX) + \frac{\mu}{2} \|K\|_{F}^{2} + \lambda \|X\|_{1} + \frac{\nu}{2} \|X\|_{F}^{2}$$

with

$$KL(Y, KX) = \sum_{i=1}^{n} \sum_{j=1}^{m} \left[(Y)_{i,j} \ln \left(\frac{(Y)_{i,j}}{(KX)_{i,j}} \right) - (Y)_{i,j} + (KX)_{i,j} \right]$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

Regularized Kullback-Leibler (Poisson noise)

• Alternating multiplicative algorithm

$$\mathcal{K}^{(k+1)} = rac{2\mathcal{A}^{(k)}}{\mathcal{B}^{(k)} + \sqrt{\mathcal{B}^{(k)} \circ \mathcal{B}^{(k)} + 4\mu \mathcal{A}^{(k)}}}$$

where

$$A^{(k)} = K^{(k)} \circ \frac{Y}{K^{(k)}X^{(k)}} (X^{(k)})^{T}$$
$$B^{(k)} = \mathbf{1}_{n \times m} (X^{(k)})^{T}$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

 $(\mathbf{1}_{n \times m} \text{ is a } n \times m \text{ matrix of ones})$

Regularized Kullback-Leibler (Poisson noise)

$$X^{(k+1)} = \frac{2C^{(k+1)}}{D^{(k+1)} + \sqrt{D^{(k+1)} \circ D^{(k+1)} + 4\nu C^{(k+1)}}}$$

where

$$C^{(k+1)} = X^{(k)} \circ (K^{(k+1)})^T \frac{Y}{K^{(k+1)}X^{(k)}}$$
$$D^{(k+1)} = \lambda \mathbf{1}_{p \times m} + (K^{(k+1)})^T \mathbf{1}_{n \times m}$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

to be initialized with arbitrary but strictly positive $K^{(0)}$ and $X^{(0)}$

Regularized Kullback-Leibler (Poisson noise)

- Can be derived through surrogates → provides a monotonic decrease of the cost function at each iteration
- Special case for λ = μ = ν = 0: the blind algorithm proposed by Lee and Seung (1999) which reduces to the EM/Richardson-Lucy algorithm for K fixed

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Properties as above for the least-squares case

- At each iteration, one can enforce a normalization constraint on the PSF (line of *K*), imposing that its values sum to one
- To do this a Lagrange multiplier is introduced and its value is determined by means of a few Newton-Raphson iterations
- The convergence results can be adapted to cope with this case

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Application : 1% (equiv. rmse) Poisson Noise; PSF normalized

Figure : $K^{(0)}$ = Unif, $X^{(0)}$ = Noisy Image, $\mu = 10^9$, $\lambda = 10^{-7}$, $\nu = 6 \cdot 10^{-8}$, 2000 it in 12m37s

Extension to TV regularization

Total Variation: use discrete differentiable approximation

$$\|X\|_{TV} = \sum_{i,j} \sqrt{\varepsilon^2 + (X_{i+1,j} - X_{i,j})^2 + (X_{i,j+1} - X_{i,j})^2}$$

for 2D images

- Use penalty $\lambda \|X\|_{TV}$ instead of $\lambda \|X\|_1$
- Use separable surrogate proposed by Defrise, Vanhove and Liu (2011) to derive explicit update rules both for Gaussian and Poisson noise

Application KL-TV: 1% (equiv. rmse) Poisson Noise; PSF normalized

Figure : $K^{(0)} =$ Unif, $X^{(0)} =$ Noisy Image, $\mu = 1.5 \cdot 10^6$, $\lambda = 0.0485$, $\epsilon = 6 \cdot 10^{-7}$, 200 it in 1m46s

◆□ ▶ ◆昼 ▶ ◆臣 ▶ ◆臣 ● ● ● ●

Application KL-TV: 2.5% (equiv. rmse) Poisson Noise; normalized PSF

Figure : $K^{(0)}$ = Unif, $X^{(0)}$ = Noisy Image, $\mu = 10^7$, $\lambda = 0.03$, $\varepsilon = \sqrt{10}$, 2000 it in 54m30s

Application to AO astronomical images

- Test images used by Prato, La Camera, Bonettini and Bertero (2013) for post-adaptive-optics astronomical imaging (PSF with Strehl Ratio 0.40), with a restoration method based on the SGP algorithm by Bonettini, Zanella, Zanni (2009) and inexact block coordinate descent (Bonettini 2011)
- Necessity to incorporate a background term in the cost function $(KX \rightarrow KX + B)$ and in the KL restoration algorithm
- Quality of restorations comparable to those of Prato, La Camera, Bonettini and Bertero (2013)

Application of NMF to Dynamic PET

(work in progress with Michel Defrise)

¹⁸ F-Fluoro-ethyl-tyrosine (¹⁸ F-FET) = artificial amino-acid for PET, crossing the Blood Brain Barrier

Pixels with FET-uptake \geq 1.6 of normal brain are considered "tumor associated"

Sum of all tumor associated pixels: Metabolic Active Volume (MAV in ml)

(slides : courtesy by Dr Hendrik Everaert) NB. Large literature on NNMF and in particular for dynamic PET, see e.g. Tichy, Smidl, 2014 International Conference on BioMedical Engineering and Informatics, Lee et al (Seoul) for myocardial H20 PET, ...

PET scan data inversion is done time by time and then the 4D dataset (nb voxels \times nb of time frames) is factored through NMF, with cost function:

- Least-squares discrepancy (Gaussian noise)
- Smoothness of the temporal activity curves (TAC)/factors: quadratic penalty on a high-pass filtered version/differences
- Normalization of the temporal activity curves (TAC)/factors: sum to one over time
- Sparsity-enforcing penalty (*L*¹-norm) on the coefficients (few factors active in each voxel)
- Spatial correlations: quadratic penalty on differences of coefficients corresponding to neighbouring voxels

A toy problem with 100 "voxels", 20 time frames, p=3 factors No spatial connection between voxels

The "true" coefficients $k_{i\,\alpha}$ are selected as follows: each "voxel" has non-zero Coefficients for two factors randomly selected from the three factors. Given two random numbers r1, r2 uniformly distributed on (0,1) the dominant coefficient is (0.5+max(r1,r2)) and the secondary factor modeling a weaker contamination is min(r1,r2). No spatial correlation is modeled.

The mean and standard deviation of the V=100 errors on the coefficients areRed factor:0.01 (0.0069)Blue factor:-0.05 (0.074)Green factor:0.041 (0.074)

Relative RMSE of the reconstructed TAC (all time bins and all voxels): 2.2 10⁻⁶ Maximum TAC error/Maximum TAC: 0.00002.

Toy problem: noisy simulation.

Despite noise and the important factor mixing, the dominant factor is identified correctly for 99 of the 100 voxels (for this noise realization). The mean and standard deviation of the V=100 errors on the coefficients are Red factor: -0.007 (0.10) Blue factor: -0.14 (0.21) Green factor: -0.15 (0.17)

Dynamic PET: clinical data

Voxels = 24037, T = 9 time frames, we select A = 3 factors. NNMF, 10000 iterations, (μ =v=0). Initialization: all factors are constant, coefficients are random.

Happy Anniversary to the Radon Transform
